Argumentative essay on technology - Best examples

Topic - Argumentative essay about role of technology in education

Technology has made its impact on almost every sphere of human life and Education is no exception. The Internet already started transforming the educational sector years ago but the COVID-19 pandemic and recent developments in augmented reality and artificial intelligence have really accelerated the role of technology in education. These developments have led many to believe that technology is being highly misused and has an overall negative influence on education but the reality is; technology has made education more accessible, personalised and interactive.

One of the biggest problems that students faced in the traditional educational system was solved by technology and that was lack of personalisation in classrooms. Teachers have to teach 20-40 students in one classroom and not everyone has similar learning capabilities which results in many students not understanding the concepts and performing badly in tests. Online learning platforms provided a concrete solution to this problem and students can now learn at their own pace.

Technology has also made all forms of education far more accessible and interactive than before. High quality information about any topic is available on platforms like YouTube, Wikipedia, Khan Academy and many more. Students now-a-days don't have limitations of learning from just one teacher in school but they can learn from any teacher across the web which they find suitable and that too free of cost, in most cases.

Many argue that technology has disrupted the real essence of classrooms and students don't pay attention to their teachers because they know that they can learn the same concepts online and even if they fail to understand it, they can always cheat and plagiarize their homeworks from the vast amounts of information available at their fingertips. It is also argued that students can never learn the values in online education that a physical teacher can teach in a physical class.

The Internet is a vast source of information and it's true that some students misuse it to copy and paste others' work but again it depends on the intent of the students and most probably they would've cheated if not from online then from any other source. This vast source of information also enables students to learn anything they wish to: from literature to history, they can equip themselves with skills they are interested in and can get information about any topic from many different perspectives which prepares them to choose from right and wrong and take decisions based on their own conscience.
Conclusion -

Technology is transforming our education system, there are many areas in which digital learning is proving itself better than traditional classrooms and the growing number of students in online learning courses is its proof. Technology still has a long way to go before being completely incorporated in the education system but it surely is the future of education and has made learning much more creative, interactive and student friendly.

Argumentative essay about advantages and disadvantages of technology -

Technology has integrated so deep in our daily lives that it's impossible to imagine today's human civilization without it. The rapid growing importance of technology and the frequent cases of its misuse and mismanagement has led some people to wonder whether Technology is really a friend or a foe but actually the advantages of technology are far more greater and clearly overshadow its disadvantages.

Technology has transformed human society for good. It has connected people all across the globe and has made access to knowledge and information possible for everyone with an internet connection. Internet banking, E-mails, E-commerce and the ease of online learning has made our lives easier. Tech companies have provided jobs to millions of people and have become engines of growth of the modern economy. The U.S tech Industry alone employs over 12.2 million workers and contributes more than 10% to its GDP.

A total of 5 billion people around the world use the internet today. It is equivalent to 63 percent of the world's total population and due to the informational, recreational and operational features it provides, more and more people are joining the internet ecosystem. Technology has also led to revolutionary developments in healthcare like: cancer nanotherapy, brain machine interfaces and Genome editing. Advanced communication and transportation technologies like super high speed railways have connected this world like never before.

Some people argue that the growing popularity of the Internet and Social media has made people (especially the younger generation) addicted to it. It is also argued that Technology has led to pollution. Air and water all over the world are polluted by industrial and domestic wastes. Radiations coming from smart phones are dangerous to birds, Oceans are turning into big patches of plastic waste and millions of trees are cut every year to make more space for new factories and cities.
While discussing disadvantages of technology the fact that it's not technology itself but it's overuse and misuse that's dangerous; is often overlooked.

**Conclusion** -

Overdose of even life-saving drugs can take life. It's over and uncontrolled usage of technology that causes pollution and in the case of social media causes addiction. If we can control the amounts and the ways in which we use technology, it can become the strongest tool for our personal and social development.

**Argumentative essay about impacts of technology on our lives and society** -

Our society and our lives have changed more in the last 100 years than it had in the last 10000 years. What caused this change is Modern Technologies like the Internet and Social media. These technologies may have connected billions of people together and according to many has bridged the gaps between borders and cultures but in reality has made our society more segregated and individuals more alone.

First and foremost, we must know that these social media companies and search engines work for profit and their profit depends on the time we spend on their apps. So, they constantly upgrade their algorithms to make them more addictive and even sell our personal data to make profits. While these companies end up making billions of dollars in profit. Normal people end up spending most of their time on these apps, giving less importance to people, moments and things that really matter.

More the time we spend on the Internet and Social media, the more we get influenced by it. Having 6-packs-abs means you're fit and strong. Dining in 7 star hotels means you're rich, traveling abroad means you're happy and earning in 6-figures means you're successful. These are the narratives that modern technologies have set and the ones failing to qualify on these false parameters become insecure, unhappy and some even start to suffer from anxiety and depression. The false sense of beauty, success and happiness that social media promotes is the reason why 70% of people don't feel happy after using them.

Many people argue that Social media allows anyone from any corner of the world to connect and be friends with anyone from other corners of the world breaking the geographical, political and cultural barriers. It is also argued that the flow of knowledge and information has never been this easy and the Internet is keeping free speech, racial and gender equality movements
alive and provides power to them and all these gives rise to a type of global human society that has never existed before and couldn't have existed without modern technology.

Social media allows people with the same interests to form groups and communities and with time, many of these groups and communities have become so intolerant to others that once they target someone, they take cyber bullying to a completely dangerous level which is the reason why many celebrities have given up using social media at all. It is also found that when people are online their behaviour changes than their physical behaviour and it can explain why hate speech, offensive comments and sexual offences are so common online. Modern technologies claim to have made this world a global village but are the reasons that physical interactions and relationships which are essential for a quality human life, are diminishing.

Conclusion -

People are decreasing their real world presence to be in a digital world that's designed to trap them as long as it can. It's nothing less than a technological slavery and way modern technologies are working today would create more seperations in society and make individuals more isolated.
